

Before you start: close NukeStudio, Hiero and Nuke. If they are open they lock the files, and the installation may fail or be left halfway through.

Automatic installation

Extract the whole `.zip` into any folder. The installer and the `Startup` folder have to stay together.

Windows

- Double-click `installer_win.bat`.

macOS

- Open Terminal in the folder where you extracted the `.zip`.
- Run:

```
bash installer_mac.sh
```

- The leading `bash` is deliberate: it works even if the `.sh` travelled inside the `.zip` without its executable permission, which fails with *Permission denied*.

What the installer does

HieroTools is not a Nuke plugin. It installs two separate items inside `~/ .nuke/python/startup/` (on Windows, `%USERPROFILE%\ .nuke\python\startup`):

- `LGA_HieroTools_Startup.py` — the startup script.
- `LGA_HieroTools/` — the folder holding the tools.

If a previous installation was found, it backs them up as `LGA_HieroTools_Startup.py.bak` and `LGA_HieroTools_backup`.

It also **adds one line at the end of your** `init.py`, unless it is already there:

```
nuke.pluginAddPath("./python/startup/LGA_HieroTools/LGA_NKS_NukeInit")
```

It stops Nuke Studio from printing a `Can't restore panel 'com.lego....'` message in the console for every HieroTools panel at startup. Nothing else in the file is changed, and a copy is saved in `~/ .nuke/LGA_init_backups/` before touching it. If you do not want that line, comment it out with `#`: the installer will not add it again.

Manual installation

If you would rather do it by hand, or the installer fails, copy the two items from the `Startup` folder into `~/ .nuke/python/startup/` and add that same line to the `init.py` of your `.nuke` folder. HieroTools works the same without it: only the console messages come back.
